4 other variables are also available to the user to write created variables results. These user variables should be computed in **PRERES_TELEMAC2D** subroutine and their name should be written in **NOMVAR_TELEMAC2D** subroutine. These seven variables are as follows: N, O, R, Z which correspond to arrays **PRIVE(1,1)** up to **PRIVE(1,4)**. Unlike the previous variables, they are kept throughout the program, so that they can be used again. In the latter case, do not forget to provide the array `PRIVE` with sufficiently large dimensions in the FORTRAN FILE. The size of the `RESULTS FILE` can be limited with this keyword. However, if a computation must be continued, the `RESULTS FILE` should contain the appropriate information for running the code,i.e.:

- velocities U and V,
- water depth H,
- bottom elevation B.

TELEMAC-2D can compute some of these variables from others.
